- 5 Different versions of our CircuitPy code
- V1 - figuring out the functionality of 1 button toggling 2 LEDS connected to 2 different ports
- V2 - a version of the program where 3 LEDS are connected to 3 different GPIO ports (mapped as output) and the button connected to a 4th GPIO (mapped as input)
- V3 - to minimize port usage, this version has 2 LEDS connected in parallel to one port and the 3rd LED connected to another port. In total, 2 ports are used for the LEDS now.
- V4 - A modification of V3 to better space out our actual physical circuit
- VFinal - final version (V4) but fully commented, spaced out, clean code!
